California Department of Food and Agriculture

Agricultural Commissioners' Crop Reports

Stanislaus County

1953-1958/59

California County Agricultural Commissioners' Reports from the California Department of Food and Agriculture. This collection consists of annual crop and livestock data from each of the 58 California Counties. The collection covers 1915-1981; digitization of the rest of the collection is forthcoming.

This digitization project was funded by the Giannini Foundation of Agricultural Economics,
<http://giannini.ucop.edu/> .

The work was completed by the staff of the Giannini Foundation Library, University of California, Berkeley, <http://are.berkeley.edu/library/> . **Please contact the Library to consult the originals.**

1954

* 100 YEARS OF PROGRESS *

Stanislaus County has approximately 963,840 acres of which 87.5% of the land is in farms. The 1950 census lists 6,610 farms with a rural farm population of 24,971 people. Sixty-one hundred of the farms or 92.3% of the farms are irrigated with a total acreage of 644,000 acres.

Stanislaus County will celebrate its Centennial birthday on April 1, 1954. In agricultural income, the county rates somewhere within the first ten - probably seventh or eighth - among the three thousand counties of the United States.

The county is first in peach production, second in total dairy cows and dairy production, second in turkey production, and fourth or fifth in walnut production. There are over 80 commercial crops grown in the county.

The income is roughly divided in half - 50% coming from livestock products and 50% from crops. Dairying is the most important industry bringing in about 1/4 of the total cash returns. The diversification of the crops, the productivity of the soil, the proper use of irrigation water and wise use of good farming practices are some of the factors which have helped to make Stanislaus County one of the leading agricultural counties in the United States.

..oOo..

Foreword

Stanislaus County's annual Crop and Livestock Summary is reported in this circular. This report has been jointly prepared by the Agricultural Extension Service and the Agricultural Commissioner of the county.

The crop report covers the acreage estimates of fruit and nut crops, along with the gross agricultural income from all crops including fruits and nuts, field and truck crops, livestock and poultry, nursery stock, and seed production crops. The gross agricultural income for 1953 amounts to about \$115,000,000 which is a drop of approximately \$10,000,000 from the 1952 total. Lower returns were realized from almonds, walnuts, dairy, beef cattle, sheep, honey production, beans, grain, alfalfa, truck crops, and seed production. The crops which slightly increased in value during the past year were apricots, clingstone peaches, grapes, boysenberries, poultry including eggs and meat birds. The greatest loss was in dairy production due primarily to a drop in dairy prices.

The figures presented represent gross income from production and not net income to the producer. To get the net income, the cost of producing the farm commodity must be deducted. Acreages of crops are reported in producing acreages only and do not include the non-bearing acreages of permanent crops. Livestock and livestock products are reported in number of sales of livestock and their products. Production is reported in units commonly used in marketing county crops and livestock products commercially in Stanislaus County. Prices are reported on the average f.o.b. basis. The gross income of the county may be duplicated in some instances where such crops as ladino clover for pasture and alfalfa, native pastures and some feed crops are produced and consumed on the same farm and be reported under both livestock and field crops.

The Agricultural Commissioner's office has included the latest data on bearing acreage of fruit, grape, and nut crops. The Agricultural Extension Service staff has figured yields and prices for the various commodities produced in the county. The agencies have made every effort to compile this report as accurately as possible, having checked with every known source of reliable information on production and prices.

We wish to express our appreciation for the cooperation and assistance of various agencies such as irrigation districts, cooperatives, local business concerns, producers, and others who have made this report possible.

MILO M. SCHROCK
County Agricultural Commissioner

ALBERT G. VOLZ
County Director of Extension

FRUIT AND NUTS

Almonds -- The 1953 almond yield was the lowest it had been since 1950, with the price being relatively the same as last year. The reason for the small crop was due to the frosts which occurred in March and April.

Apricots -- The apricot acreage has become stabilized, there being approximately 2,000 acres in the county. The 1953 crop was the best it had been for the last five years. As most of the apricots are located in the Patterson district, they were not affected by the frost. The price was good even though the crop was large.

Peaches, Clingstone -- The clingstone peach crop in Stanislaus County during the 1953 season was affected by frosts which occurred on March 3 and between April 7th and 10th. Different areas were affected by the frost and consequently the crops were spotted - some areas having full crops and other areas having very poor crops. The total tonnage of the county was about 30,000 tons greater than 1952 when the industry had a 15% green-drop program. The price dropped from \$65 to \$55; however, the total income from the industry was slightly greater from the increased tonnage harvested.

Peaches, Freestone -- The freestone peach crop was about normal with a few of the orchards being affected by frost. The total tonnage produced amounted to about 26,000 tons during the last few years. The price was \$55 a ton, the same as in 1952.

Nectarines -- The nectarine crop was very light because of injury by local frosts. With less than half of the usual amount of nectarines produced, the prices also were slightly less than they have been in previous years.

Cherries -- Cherries are one of the minor crops produced in the county - only 61 acres still in production. Last year's crop was a little lighter than usual and the price was only fair.

Figs -- Figs are becoming less and less important as a commercial crop with only a few acres producing. Last year the crop was light and the return from the shipped fruit was relatively low.

Plums -- The plum crop was about normal; however, prices of shipped plums were lower than they were the previous year. Plums are also one of the minor crops in the county.

Olives -- The weather conditions seriously affected the olive crop in 1953. The olive varieties which are usually harvested for canned olives had practically no crop and the few olives which produced were used for oil purposes. The average yield for all of the olives in the county amounted to less than 500 pounds per acre.

Walnuts -- The walnut acreage in the county has been increasing very rapidly - 8,374 acres of bearing walnuts reported this year. Poor weather conditions adversely affected the crop so that the yield in 1953 was the lowest it had been during the last five years. The price of the crop was about the same as the previous year. Hot weather during the summer months and a large infestation of codling moths caused the quality of the crop to be poor and percentage of cull nuts to be high.

Grapes -- A succession of severe frosts hit the vineyards in the county. Thompson Seedless were leafed out and many lost their entire crop. Even those vineyards that were not hit by frost suffered a reduction in crop. The price per ton was considerably above the previous year so the over-all income for grapes was increased.

Boysenberries -- This was an excellent season for producing boysenberries. Several plantings were up in the ten ton per acre class and the price was very favorable. The wineries bought rather heavily and a third major canner was in the field for the first time. Proposed plantings in 1954 is around 500 acres.

Strawberries -- This was probably the most productive year for strawberries in the county since the advent of the University varieties. Some growers experienced an almost continuous crop. In spite of the large crop prices to growers held firm all season.

FIELD CROPS

Alfalfa -- Alfalfa hay acreage increased by 10 per cent but returns dropped considerably as the average price dropped from \$30.50 down to \$20.50 per ton, resulting in a loss of total income of about \$2,400,000. Yields were somewhat better than normal and quality was generally good.

Beans -- Total bean acreage increased about 10 per cent and the gross value of the crop was a little higher than in 1952. Yields of all varieties were generally higher than average because of a cool summer. Prices at the start of the season were generally good, but as the season progressed, the market weakened and it appears as though there will be a considerable carry-over of blackeyes and lima varieties with accompanying weakening of the market.

Baby lima beans accounted for about half of the increase in acreage and the return of \$8 per hundred resulted in a doubling of the value of the crop.

Blackeye acreage accounted for the remaining increase and yields of all varieties were exceptionally good. The blackeye price dropped considerably and the total value of the crop was less than in 1952, in spite of an acreage increase of more than 20 per cent. Acreage of large limas and other bean varieties dropped somewhat.

Grain -- Small grain acreage was about the same but the income received by farmers was down about 10 per cent due to generally lower prices. Non-irrigated barley yields were off slightly because of the dry spring.

Field Corn -- Acreage increased a little and yields were quite satisfactory. Corn silage continues our best producer of summer feed for dairy cattle.

Sudan Grass -- Sudan grass acreage dropped. The crop is used mainly for dairy cattle in the irrigated sections.

Irrigated Pasture -- The unusual dry period during February, March and early April created a heavy demand for irrigated pasture early in the season. Acreage continued to expand.. Numerous fields which were planted for seed production were used for pasturing.

Rice -- Rice continued to gain in acreage because of the favorable price outlook. Yields were down a little because of the cool season and the total income received by farmers increased only slightly because of a lower price received.

TRUCK CROPS

Green Lima Beans -- Acreage in green lima beans increased by almost 40 per cent. Yields were up about 400 pounds an acre and with a higher price, the value of the crop almost doubled. This crop will probably increase in acreage again in 1954 unless the price drops.

Melons -- Acreage decreased about 40 per cent from the previous year, but yields of cantaloupes were up about 20 per cent. The market price was about the same. Watermelon acreage decreased some because of the rind rot fear and prices were up. Rind rot did not show up appreciably in plantings this year.

Peas -- Severe frosts seriously reduced the yields and weeds were a big problem as many growers were forced to irrigate early.

Spinach -- Acreage was down slightly and yield was about the same as 1952.

Sweet Potatoes -- Acreage was up about 25 per cent, but prices were down considerably. Yields remained about the same.

Tomatoes -- Acreage dropped about 2,000 acres and yields increased. The reduction was all in those tomatoes planted for ripe canning. Green shipping tomatoes increased in acreage slightly, but prices were down in all outlets.

SEED PRODUCTION

Alfalfa -- Certified alfalfa seed acreage continued to increase but the value of the crop was considerably less because of a lower yield and a reduced price. Common alfalfa seed was further reduced to the point where only 317 acres were cut for seed in the county. The market for certified varieties strengthened as the season progressed and the outlook is rather favorable for the coming year.

Ladino Clover Seed -- Acreage dropped considerably as the outlook was poor for 1953. A severe decrease in price, accompanied by a lower acreage, resulted in only 520 acres of certified Ladino clover seed and 50 acres of Common. The large supplies of seed held in storage continued to exert a depressing effect on the market.

LIVESTOCK, POULTRY, AND DAIRYING

Beef Cattle -- Short feed in the range area in the western part of the county shortened the grazing season. Range was better but not quite up to par in the eastern section. Numbers on irrigated pasture showed a slight increase. Stockers were purchased during the fall of 1953 at prices ranging from 15½¢ to 18¢. Prices held firm on slaughter cattle during the fall period.

Hogs -- Hog numbers increased due to higher prices. There was very good demand for breeding stock.

Sheep -- Numbers remained about the same. The late dry fall made possible later use of alfalfa pasture for lambing.

Rabbits -- Rabbit production took a slight increase in the county this year in both total number of rabbits and new operators. The fur price has been lower because of regulations on naming the kind of fur that is being put into garments. There are still not enough rabbits produced to meet the demand. Rabbit meat prices remained about the same as the previous year.

Egg Production -- Egg production in this county took a substantial increase in 1953 of approximately 10 per cent over 1952. This increase was shown both in larger flocks and more producers. Egg-feed ratios were very favorable to the producer this year. Egg prices held up well throughout the fall and winter with egg prices averaging $4\frac{1}{2}$ to 5 cents more per dozen than 1952.

Broilers and Fryers -- The broiler-fryer business has leveled off somewhat in the county with about an equal number of operators coming into the business as going out. Prices have been very close to the production costs, leaving a very small margin of profit for the operator. The squeeze from out-of-state producers has definitely been felt in California.

Turkey Production -- Stanislaus County fell in line with the rest of California in reducing its turkey numbers for 1953. The reduction was somewhat less than was expected earlier in the year. The number of fryer-type turkeys was reduced greatly. Nineteen hundred fifty-three would be a good year on which to establish some base costs and prices since it was a year that few turkey men became rich, few producers went broke, and the average producer made a substantial living.

Turkey Egg Production -- There was a slight increase in the number of breeders in both heavy and light breeds of turkeys in the county. This indicates that there will be more poults for the year of 1954. Turkey egg prices remained about the same as in 1952.

Dairying -- Dairy production in the county increased somewhat during the year due partly to an increase in the number of dairy cattle. Producers suffered somewhat from the lowering of price during the year; however, this was pretty largely offset by reduction in the price of hay compared to the previous year. Culling continued at about the same rate as usual; however, a few dairymen felt that with lower price it was necessary to carry a few extra cows to meet their financial commitments. There is still a slight trend of beef cattle ranches being changed over to dairy ranches but this does not affect too many cows. We have had a very definite conversion of Grade B facilities over to Grade A facilities due to the large differential in price between Grade A and Grade B milk. Grade A contracts have been at a premium but with the large differential dairymen have felt it was worth the chance and so have put in Grade A facilities.

Honey -- The honey production from 20,000 hives in the county amounted to 45 pounds per hive. Bees were used for pollinization in almonds and also in various seed crops.

1954 Annual Crop and
Livestock Report

STANISLAUS COUNTY

UNIVERSITY OF CALIFORNIA
DAVIS

AGRICULTURAL EXTENSION SERVICE
and
DEPARTMENT OF AGRICULTURE
Cooperating

Foreword

The 1954 Stanislaus County Annual Crop and Livestock Report is listed in this circular. This report has been jointly prepared by the Agricultural Extension Service and the Agricultural Commissioner of the county.

The crop report covers the acreage estimates of fruit and nut crops, along with the gross agricultural income from all crops including fruits and nuts, field and truck crops, livestock, poultry, nursery stock, and seed production crops. This report indicates the gross returns and does not report the net returns to the growers. In order to obtain net income, the cost of producing the farm commodity must be deducted.

Acreages of crops are reported in producing acreages only and do not include the non-bearing acreages of permanent crops. Livestock and livestock products are reported in the number of sales of livestock and their products. Production is reported in units commonly used in marketing county crops and livestock products commercially in Stanislaus County. Prices are reported on a f.o.b. basis, or as gross return to the farmer. There may be some duplications in the gross returns reported in this report because in some instances, such as alfalfa hay, permanent pastures, native pastures, and some feed crops are produced and consumed on the same farm; and the reporting of their sales may be both listed as livestock sales and as sales of field crops.

During the past year this office has, in cooperation with the State Department of Agriculture, made a detailed survey of acreages in the county. This procedure is customarily done every four or five years. In the interim years acreage changes are only tabulated as the information is available to the local office. Therefore, there has been some change in acreages listed between the 1953 permanent crop acreage and the 1954 acreage figures.

The gross agricultural income for 1954 amounted to \$112,709,676 as compared to \$115,388,782 in 1953, showing a drop of close to \$3,000,000 in gross income.

The greatest drop occurred in the dairy industry where about 2½ million dollars less was reported. Other crops showing decreases in income are beef cattle, poultry, turkeys, clingstone peaches, walnuts, and several other crops. Crops making the greatest gain in comparison with the previous year are grapes, field crops, truck crops and seed crops.

In compiling this report, the Agricultural Commissioner has included the latest data of acreage and permanent crops, while the Agricultural Extension Service has figured yields and prices for the various commodities produced in the county. The agencies have made every effort to compile this report as accurately as possible, having checked with every known source of reliable information on production and prices.

We wish to express our appreciation for the cooperation and assistance of various agencies such as irrigation districts, cooperatives, local business concerns, producers, and others who have made this report possible.

MILO M. SCHROCK
County Agricultural Commissioner

ALBERT G. VOLZ
County Director of Extension

FRUIT AND NUTS

Almonds - - The 1954 almond crop showed the lowest yield since 1944. The yield amounted to only 575 pounds per acre. The price received for almonds was the same as it was in 1953.

Apricots - - There was a normal apricot crop in the county. However, the acreage of apricots has been dropping every year until now there is less than 1,800 acres of apricots in the county. The apricot price was about the same as in 1953 except for dried apricots which sold as high as 38¢ per pound.

Peaches, Clingstone - - The clingstone peach crop in Stanislaus County was good with a heavy set. In order to limit the production, the State Control Board set a 17% green drop which caused a reduction of some 13,000 tons under that produced for 1953. Because of the heavy set, sizes were not too good and growers experienced some difficulty in sizing some of the early varieties. The price was \$55, the same as in 1953. However, with a lower tonnage sold, the income dropped some \$800,000.

Peaches, Freestone - - The freestone peach crop was about normal in the county with about the same tonnage being produced as in 1953. The price of \$50 a ton, a drop of \$5 from last year, was received. There was a considerable increase of the tonnage frozen, with some decrease in the tons that were dried.

Nectarines - - The nectarine acreage is on the increase in Stanislaus County, with a considerable interest in several of the newer varieties which have been selling at premium prices on Eastern markets. The income from nectarines more than doubled the past year; however, some of the early varieties, such as John Rivers, had a very little crop because of delayed defoliation caused by the warm winter.

Cherries - - Cherries are one of the minor crops in this county with only 71 acres in production. There was a normal crop this year with prices fairly good.

Plums - - Plums are also a minor crop with only 46 producing acres. Prices of shipped plums were better than a year ago. Some growers received as high as \$200 a ton for shipped plums.

Olives - - The olive crop was about 75% normal, averaging about 3 tons per acre. The price of canned olives varied from \$175 to \$300 a ton; whereas, the price of olives for oil was considerably cheaper and many growers received very little return from olive oil.

Walnuts - - The walnut crop in the county was just as good as in other walnut producing areas. The 1954 season was disappointing. Hot weather during the growing season was probably the cause of a large amount of damage, along with lighter sets in some of the varieties. The acreage in the county has increased each year until at the present time there are over 9,000 acres in production. This is approximately a 1,000 acre increase over 1953. Prices on the average for the crop dropped from \$430 a ton in 1953 to \$375 in 1954. Total returns on the crop amounted to \$1,700,000; whereas, the previous year the returns added up to \$2,100,000.

Grapes - - Climatic conditions were quite good for the growing of grapes this past season. This, in addition to the pulling out of many of the vines growing under dry land conditions, accounts for a large increase in average yields. Based on average yields, the gross return for the grapes is considerably higher than the past year; although, the price received per ton was down slightly. Indications are that the acreage is now stabilized.

Boysenberries - - Boysenberry yields were very good although an examination of the figures does not necessarily reveal this because there was no stripping of the vines for the winerys. Approximately 500 acres were put in and an anticipated additional 200 acres is expected for 1955.

Strawberries - - The early crop was very productive with many of the growers complaining of reduced yields in the second crop; the reduced yields probably being caused by the severe hot weather in August. The price was down slightly, and the outlook for strawberries continues good.

FIELD CROPS

Alfalfa - - Alfalfa hay acreage was down a little and total tonnage was reduced further by the fact that the acreage of Common alfalfa harvested for seed increased by more than 3,000 acres. Hay prices were about the same. Carryover into the 1955 season will be practically none, due to heavy usage during winter months.

Beans - - Total acreage planted to beans shows a slight increase. Increases were mostly in baby limas and miscellaneous varieties. Prices of baby limas dropped considerably and large limas showed a smaller drop. Blackeye prices were somewhat higher, reflecting over-all balance of supply and demand. Outlook may be for lower acreages, due to lower support prices.

Grain - - Barley acreage was up slightly but the income received by farmers was down a little due to lower prices.

Field Corn - - Acreage harvested for grain about doubled with yields about normal. Corn harvested for ensilage increased considerably as dairymen continue to make better use of this excellent feed. There is still room for increase in corn acreage which can be easily used by the local poultry and dairy industry.

Sudan Grass - - Sudan acreage increased moderately. The crop continues to be used mainly for dairy cattle in the irrigated section.

Rice - - Rice acreage increased because of the favorable price outlook (1953 crop report figures were found to be higher than actually was the case). Prices dropped considerably, however, as national supplies continued to pile up in warehouses. Rice yields were down because of the exceptionally cool summer and fall weather.

TRUCK CROPS

Green Lima Beans - - Green lima bean acreage again increased, even though prices were down slightly from 1953. Lower yields were also the case, due to unfavorable growing conditions.

Cantaloupes - - County acreage was down in 1954. Early marketing was unsatisfactory but recovered rather well later in the season.

Watermelons - - Planting was increased by 500 acres. Price per ton was down 33% which resulted in a low total value of the crop.

Spinach - - Acreage remained stable but the yield was down 1/2 ton. With a reduction of \$2.50 per ton in price, the deal was somewhat less satisfactory.

Sweet Potatoes - - Acreage was up over 100% from 1953, with yield about the same. Opportunities for increased yield and quality seem to be greater for this crop than for most others.

Tomatoes - - Although the canning price was down, the yield was up by about one ton per acre. Favorable weather late in the season helped the shipping tomato enterprise considerably.

SEED PRODUCTION

Seed Production - - Certified alfalfa seed acreage continued to increase as this crop gains favor with Westside farmers. Yields were about the same as last year but prices were more favorable.

Common alfalfa seed acreage increased from 317 to 3,700 acres, due to a very active market caused by seed failures throughout much of the rest of the world. Outlook for both of these crops appears to be good for the 1955 season.

Ladino Seed Production - - Due to the low price, certified seed production of certified Ladino seed in the county was nonexistent this past year. There were a couple of relatively small fields of common seed harvested, but not sufficient to be considered in preparing this report.

LIVESTOCK, POULTRY, AND DAIRYING

Beef Cattle - - There is a definite trend toward more farm-size feed lots in the county. There is also more supplemental feeding being done on pasture this year. There was good early feed in the Eastside range land, but the feed dried up considerably prior to the last spring rains. Rainfall on Westside range area was very short.

Hogs - - There was some curtailment in swine production this past year due to the VE quarantine. Several small garbage feeders went out of business rather than rig up for cooking. Those producers who are cooking garbage are very well satisfied so far with the results they are having.

Sheep - - Number of range sheep remain about constant. There seems to be a small increase in farm-size flocks.

Rabbits - - A substantial increase was shown in the rabbit fryer industry in Stanislaus County over 1953. There has been both an increase in the size of the herds and the number of rabbit raisers. The market is demanding a high quality, dressed, packaged rabbit. The industry needs a good consumer educational program as well as a continued and improved production and management program.

Chicken Eggs - - An 8% increase in the number of eggs sold for human consumption was shown in 1954 over 1953. Many new flocks were established and some new producers. The unforgettable year, 1953, of high egg prices and relatively low comparable feed prices was probably the cause of the new influx. The 1954 egg-feed ratio was the widest in many years.

Chicken Meat - - Fryers - Production down and farm income down. Over a year of very unfavorable producer prices forced many people out of business. The larger, more efficient producers are still in business and are making a small profit. Over production in many states has been felt in the West, especially in California.

Hens - - Lowest prices received for hens since the depression days of the '30's. Hens sold for less than 50% of the average 1953 price. Some light-type hens held on the market at 8 cents a pound.

Turkeys - - Meat - Stanislaus County, along with California and the rest of the United States, took a setback in the 1954 turkey crop. There was a small decrease in production and the price was down considerably from 1953. The fryer-type turkey was down in both numbers and demand.

Breeder Flocks - Breeder flocks showed a decrease and about 20% less eggs were sold for hatching purposes. Prices received for eggs showed a decrease of 3 cents to 8 cents per egg in 1954 over the average 1953 price.

Dairying - - Dairy production in the county increased slightly during the year, however, this was offset by a greater reduction in price, both for manufacturing and market milk. There was another change somewhat to the disadvantage of dairymen who buy their feed late, in that many went into the winter months with a shortage of feed on hand, and later had to pay a higher price. Culling continued at about a usual or slightly higher rate, although a few dairymen felt that they had to carry extra cows to meet their financial commitments. The over-all increase in the size of herds has continued so that the average herd is about 20% higher than it was some four years ago. Due to the surplus of Grade A milk, there has been practically no conversion from Grade B to Grade A facilities. Most of the new barns were constructed to take the place of those that were abandoned. Grade A contracts have continued to be at a premium.

MISCELLANEOUS

Honey - - The honey production from 20,000 hives in the county amounted to 50 pounds per hive. Bees were used for pollinization in fruit crops and also in various seed crops.

1955

Annual Crop
and
Livestock Report

STANISLAUS COUNTY

AGRICULTURAL EXTENSION SERVICE
and
DEPARTMENT OF AGRICULTURE
Cooperating

Foreword

This report contains information on conditions, acreage, production and value of agricultural crops produced in Stanislaus County for the year 1955. The report has been jointly prepared by the Agricultural Extension Service and the Agricultural Commissioner of the county.

The Crop and Livestock Report includes data on over 80 commercial crops which are grown or produced in the county. Acreages of permanent crops are reported of actual bearing acres and other crops are reported in harvested acres. Production is reported in units commercially used in the marketing of crops in this county. Prices were reported on a F.O.B. basis or as a gross return to the farmer. This report only indicates gross income and does not report the net returns to the grower. In order to obtain net returns, the production costs of the farmer must be deducted. There may be some duplications in the gross returns reported because in some instances crops such as alfalfa hay, permanent pastures, native pastures and some seed crops are produced and consumed on the same farm. The reporting of their sales may be listed as livestock sales and as sales of field crops.

Agricultural income in Stanislaus County reached an all-time high in 1955, with an income of \$130,781,000. This amounted to almost 4 million more than the previous high returns of \$127,000,000 in 1951 and a \$112,700,000 in 1954 - a gain of 18 million dollars over the previous year. Two thirds of this gain was due to the increase of returns for the fruit and nut crops. Clingstone peaches, almonds and walnuts all brought phenomenal incomes. Dairy production increased almost 10%, counting for a little over 3 million gain in the 1955 dairy income. Poultry also showed a big increase in commercial and hatching eggs sold. Egg prices remained about the same, but the total income was up from \$5,953,000 to \$7,486,000. Turkey growers also received a better income for the 1955 year because of higher prices and more birds sold.

Total returns from field and truck crops remained approximately the same for the two years. There were some fluctuations of prices, while some crops brought less and others more. The income from beef cattle, sheep and hogs was slightly down along with such commodities as seed crops and grapes.

In compiling this report, the Agricultural Commissioner has included the latest data of acreage and permanent crops, while the Agricultural Extension Service has figured yields and prices for the various commodities produced in the county. The agencies have made every effort to compile this report as accurately as possible, having checked with every known source of reliable information on production and prices.

We wish to express our appreciation for the cooperation and assistance of various agencies such as irrigation districts, cooperatives, local business concerns, producers, and others who have made this report possible.

ALBERT G. VOLZ
County Director of Extension

MILO M. SCHROCK
County Agricultural Commissioner

FRUITS AND NUTS

Almonds - - The almond crop during the past year amounted to about twice the production in the county compared to the previous year. The price almost doubled, and therefore, the income from almonds was probably the highest it has ever been in the county.

Apricots - - The apricot crop was about average with also a normal price. The income was up slightly over the previous year because of a higher yield per acre. The apricot acreage is located primarily on the west side of the county with less than 2,000 acres in production.

Clingstone Peaches - - The 1955 season was one of the most profitable seasons that the clingstone peach growers experienced in the industry's history. There was an average normal good crop and the price per ton was the highest since 1929. The reason for the price being so high was that other peach growing areas in the state were hit by frost and this county had very little frost injury. The income from the clingstone industry in the county almost doubled as the income in 1954 amounted to 8,400,000 compared to 15,900,000 in 1955. The high income received from clingstone peaches during the current year has created considerable interest in an increased planting of acreage of clings in the county.

Freestone Peaches - - There was an average good crop of freestone peaches produced. However, the price, especially early in the season, was better than average. Frost occurring in the southern and eastern states greatly curtailed the U.S. peach crop. Eastern shipments were heavy during the early part of the season because of the higher price at the time. There was also considerable local market demand with peaches being shipped and hauled by truck to San Francisco and Los Angeles.

Nectarines - - There is an increased interest in planting some of the newer varieties, such as the Le Grande nectarines in the county. Practically all of the nectarines produced are shipped east. There was an increased production during the current year with prices about average.

Cherries - - Cherries amounted to only 47 acres, being considered a minor fruit crop. Most of the cherries are either processed or brined. A small amount are used locally.

Plums - - Plums are becoming less and less in importance as a crop in the county. At the present time there are only 38 acres. Most of the plums are shipped and this year's price was about \$140.

Olives - - There was a very small crop of olives due to frost injury and also because of a heavy crop the previous year. Most of the olives were sold as pickling olives - around \$250 a ton - and a small amount were sold for oil for about \$60 a ton.

Walnuts - - The income from the walnut crop, like that of peaches and almonds, greatly increased during the past year. Stanislaus County enjoyed the benefits of a good crop with very little heat damage and an increased price from 19-3/4 to 30¢ per pound. The value of the walnut crop increased from \$1,700,000 to \$3,800,000 during the past year. Walnuts are becoming a very popular crop in Stanislaus County. The acreage has been increased each year until we now have approximately 10,000 acres of bearing walnuts with some 2,600 non-bearing acres.

Grapes - - Climatic conditions during fruit set on the Thompsons were poor. As a result, most of the vineyards had many loose, stringy bunches. Many of these recovered by having larger berries; however, the end result was a lighter crop than anticipated. Wine grapes did not seem to be affected in the same manner so that crops were normal or slightly above average. Thompson vineyards are being pulled out and, in some instances, being replaced by tree fruits. Most new acreages consist of Palomino, Grenache, and French Columbard. The prices received were below those of the previous year due to reported bumper yields from counties south of Stanislaus.

Boysenberries - - For some reason still not explained but believed to climatic, the boysenberries throughout the county were very slow in leafing out. Many growers complained of very small berries. The small berries, in turn, were responsible for a poor pickout by the pickers. Consequently, yields were far below that anticipated early in the season. Due to the large anticipated crop, most of the crops were contracted for early at a price about three cents below the price received the previous year. There will be 200 acres more in bearing than in 1955.

Strawberries - - Yields were slightly above average for both first and second crops with the second crop continuing well on into the season so that some of the growers reported higher yields than they had in the past. Acreages are continuing to go up; however, the outlook continues to look good in this area.

FIELD CROPS

Alfalfa - - Acreage remained about the same but prices were considerably better because of greater livestock numbers and unfavorable winter and early spring weather. Yields were up because of a mild fall. Returns per acre were very favorable. Acreage in 1956 would probably be greater if it were not for the threat of a new pest, the spotted alfalfa aphid.

Beans - - Total acreage decreased considerably, with the greatest amount in baby limas and smaller decreases in blackeyes and "Other Varieties." Large lima acreage almost doubled. Yields of all varieties were down considerably because of unfavorable weather. Prices of all varieties except baby limas dropped and returns were much lower. Outlook for 1956 indicates possibility of continued low prices for most varieties.

Grain - - Acreages remained about the same. Average barley yields were up a little, mainly because of good irrigated crops. Montpellier yields were about the same with very good quality. Irrigated Westside milo yields were very good. Prices of all grains were down. Outlook for 1956 is for lower prices because of lower supports.

Field Corn - - Acreage planted for silage increased again as dairy and beef farmers continue to make better use of this excellent feed. Self-feeding silos and machinery for handling silage make silage "more popular." Acreage grown for grain decreased slightly and probably will not increase in the future unless Westside growers find it profitable. Silage acreage will probably increase again in 1956.

Sudan Grass - - Acreage remained about the same. The crop continues to be used mainly for dairy cattle in the irrigated section.

Rice - - Rice acreage decreased greatly as acreage allotments came into being. Yields were well up from 1954 and prices remained about the same. Prospects for 1956 are for probable lower acreages if acreage allotments are again in force.

TRUCK CROPS

Broccoli - - Broccoli is a minor crop in Stanislaus County. It has been profitable on a limited acreage grown as a winter crop.

Lima Beans - - Lima Beans for processing took a slight acreage slump in 1955. Yield per acre was down slightly as well as the price.

Cantaloupes - - 1955 was a bad year - the yield was high and the acreage was about normal. During the time Stanislaus cantaloupes were being marketed, the price kept slipping and reached a point where it was unprofitable to continue harvesting. Several hundred acres were abandoned.

Honeydews - - Honeydews did not yield as well as in 1954, and the average price for the season was down about \$4.00 a ton.

Other Melons - - Other melons were in more than adequate supply which resulted in an unfavorable market for many growers.

Watermelons - - Acreage was up slightly in 1955. The price averaged over \$2.00 higher. Harvested tonnage was about the same as in 1954, about 11 tons to the acre. Heavy culling was required because of cracked heart so the tonnage sold was less than in 1954.

Peas - - Canning and freezing pea acreage was down in 1955 by 250 acres. The increase in yield and price made the pea deal considerably more attractive than in the previous year.

Spinach - - Spinach acreage went up 940 acres. This larger acreage and the ton and one half heavier yield per acre increased, more than double, the dollar volume of the spinach crop.

Sweet Potatoes - - Acreage declined very slightly as did the acre-yield. The selling price was up about \$1.00 a basket which more than compensated for the lower volume.

Tomatoes - - Shipping tomato prices held up well throughout the season, making this speculative enterprise attractive in 1955. Canning tomato volume per acre was down slightly. Considerable acreage was picked for shipping and then for canning, which may account for the slightly lower yield of canning tomatoes.

SEED PRODUCTION

Alfalfa - - Certified acreage almost doubled as a result of very favorable returns in 1954. Yields were almost 25 per cent lower because of unfavorable summer weather and prices decreased about 15 per cent, resulting in much lower income per acre.

Common alfalfa seed acreage remained the same as 1954. Yields were down about 7 per cent and prices also dropped.

Ladino Clover - - Acreage of ladino seed is no longer large enough to report separately, so it is included under "Miscellaneous Seed."

LIVESTOCK, POULTRY, AND DAIRYING

Beef Cattle - - The number of fed cattle produced in the county more than doubled this past year. This was due to enlarging size of farm feed lots, some new farm feed lots getting started and two new commercial lots starting. The number of cattle produced or grown out remained about the same due to a lower price gross return.

Swine - - Hog numbers increased some over 1954. Total return was less due to very low prices.

Sheep - - Number of range bands remain about constant. Farm flocks are on the increase.

Rabbits - - The rabbit industry is still primarily a backyard hobby type operation in Stanislaus County. There is some evidence that larger operators will be coming along soon. The market for rabbits has been strong, although poultry and the red meats are in strong competition pricewise. The industry needs more cooperation from its members in consumer education and improved production and management practices.

Chicken Eggs - - 1955 was considerably better than 1954 for the commercial egg producers. There was an increase in egg production amounting to more than 8%. Many new flocks are being established and old ones are expanding. The 1955 egg-feed ratio was much better than in 1954.

Chicken Meat - - 1955 was a profitable year for broiler growers on the average. Prices received were somewhat higher than last year and higher than the national average. Lower feed costs and more efficient feed conversion teamed up to increase profits. There was no substantial increase in production over 1954. Competition from eastern producers is being felt in all of California.

Hens - - Heavy hens have been selling for as much or more than fryers. Light hens have regained their value somewhat but are still in a very poor position marketwise.

Turkeys - - 1955 was a good year for the turkey grower. Most growers sold birds at somewhat lighter weights, thereby reducing total tonnage. Prices received by growers were sufficient to allow a good profit. The fryer-turkey industry seems to be on the decline.

Breeder Flocks - - Breeder flocks were on the increase over 1954. Prices received for eggs were essentially the same as in 1954, although demand was good. Many producers lost flocks because of outbreaks of sinusitis. Poor fertility is still a costly problem in turkey breeders.

The poultry industry in Stanislaus County has grown to a value of 17 million dollars in 1955, an increase of over 4 million from 1954. Better marketing, more production and efficient production methods have made the difference.

Dairying - - Dairying continues to be the No. 1 industry in the county with approximately 1/4 of the total income coming from the dairy industry. During the past year the amount of milk produced as market milk increased; however, the price remained about the same. With the increased production, the total income was up 10%. The manufactured milk increased and the price per pound was increased 4¢ a pound, giving a total increase of income of a little over 2 million. The price of alfalfa hay was up during the past year; however, the price of concentrates, including the cereal grains, was down which somewhat compensated for the increase of price for hay. Culling of dairy cattle continued at about the normal rate, although the price of culled dairy cows was somewhat less. Dairy herds have continued to increase in size because it becomes more and more necessary for a dairyman to have more cows in order to make money in the dairy industry.

AGRICULTURAL EXTENSION SERVICE
and
DEPARTMENT OF AGRICULTURE
Cooperating

Foreword

The gross agricultural income of Stanislaus County reached an all-time high of \$133,890,060 for the year 1956. This income amounts to approximately a three million increase over the income of 1955. Stanislaus County produces over 80 commercial crops; and because of the great diversity of crops grown, the agricultural income has been very stable. Some of the increase of income during the past year has resulted from the increased growth of truck crops such as tomatoes, honeydew melons, carrots, onions, broccoli and green beans, which are grown on the west side of the county. Income from the dairy industry also increased due to increased production and a higher price. Dairy continued to be the No. 1 agricultural industry, amounting to about one-fourth of the total income. Returns from grapes and berries were also up with higher prices and better yields for berries.

Peach and walnut returns were both down due to less yields and lower prices. Alfalfa hay income was also considerably less than the income in 1955. This lower income was also reflected in other field crops such as the cereals, feed crops, as well as in the poultry industry.

This report contains information on acreage, production, value and conditions of agricultural crops produced in Stanislaus County for the year 1956. Prices are reported on an F.O.B. basis, or as a gross return to the farmer. The gross returns should not be confused with what the farmer may retain as his net returns. Acreages of permanent crops are reported in actual bearing and non-bearing acres, while other crops are reported on a harvested acreage basis. Production is reported in units commercially used in marketing of crops in the county. Some duplication may result from reporting gross returns on feed crops and livestock sales where feed crops are grown and consumed on the same farm by livestock on that farm.

Every effort is made to make this report as nearly correct as possible; however, in some produced commodities the acreage and production must be estimated.

This report has been jointly prepared by the Agricultural Extension Service and the Agricultural Commissioner's office of the county. The Agricultural Commissioner has included the latest data of acreage on permanent crops, while the Agricultural Extension Service has figured yields and estimated prices for the various commodities produced in the county.

We wish to express our appreciation for the cooperation and assistance of various agencies, such as irrigation districts, cooperatives, local business concerns, producers and others who have made this report possible.

ALBERT G. VOLZ
County Director of Extension

MILO M. SCHROCK
County Agricultural Commissioner

FRUITS AND NUTS

Almonds - - The yield of almonds was about as good as could be expected with an almost all-time high yield. Prices ranged abnormally high because of the small crop produced in Southern Europe and the Mediterranean area. County bearing acreage dropped slightly during the past year, but considerable new planting has taken place the last several years.

Apricots - - The 1956 crop was about 10 per cent less than the 1955 crop. Prices, especially for canned apricots, were considerably better - resulting in an increased income for apricot production in 1955. There were less apricots dried this year than previous years. Bearing acreage hit a low point of approximately 1,750 acres during the year. However, this acreage should increase in the near future because of the plantings of new apricots, principally on the west side of the county.

Clingstone Peaches - - Stanislaus County produced a large crop of clingstone peaches - about the same tonnage as 1955. However, the total tonnage processed was less because of the 7½ per cent set-aside at the cannery level, called for through the Marketing Agreement, to take care of the surplus production. Prices dropped about \$10 per ton due to the large crop. Bearing acreage is up 1,334 acres in the last year and new plantings were increased considerably.

Freestone Peaches - - The freestone peach crop was about normal, but prices were not too good for local sales and for some of the shipped fruit. The dried fruit market was the brightest picture in the freestone deal because of the small amount of fruit dried. Some varieties of freestones have also been sold to advantage to freezers in California. Like clingstones, there has been a fairly large new planting of freestones in the county during the last several years.

Nectarines - - The nectarine crop was good with more production of the newer varieties. These varieties have been selling at a higher price than many of the old varieties like the Quetta. Nectarines are becoming a popular crop and the planted acreage has been increasing rapidly during the last years. Most of the nectarine crop is shipped east, or some of the fruit has been sold in San Francisco or Los Angeles and the culls are normally dried.

Walnuts - - Walnut production was down in 1956 as compared to the large 1955 crop. The crop was short approximately 1,000 tons from the previous year. The 1956 price averaged about seven cents per pound less than the 1955 price. The decrease in yield and the drop in price resulted in a \$1,400,000 drop in the county income.

Olives - - The olive crop was fairly good and the price about average. However, early frosts did some damage to the olives used for oil and it caused a reduction in the total crop harvested.

Figs, Plums and Cherries - - These are all minor crops in the county - there being less than 50 bearing acres of these tree crops. There is some interest in increasing the cherry acreage in the county, but the plum and fig acreage is gradually diminishing.

Grapes - - Yields for all varieties were down approximately 15 per cent. This is not shown in the statistical report because of more accurate reporting from wineries and other handlers. Mildew was reported heavy in all parts of the county. Yields were down due to thrips, cutworms and season. The prices received were much better than the year previous except for cannery Thompsons. Plantings will be considerably heavier than normal.

Boysenberries - - The boysenberry acreage increased an additional 200 acres. Yields were very good and quality was high. An expected higher price due to the severe freeze in the northwest and droughty conditions in the south did not materialize. It is expected there will be an additional 200 acres to harvest in 1957.

Strawberries - - The strawberry picture was one of great disappointment to the growers in this area. Early in the season late rains caused heavy losses due to soft rot. Later thrips and poor pollen caused losses due to catface and nubbed berries. At about mid-season the price dropped from 17 cents to 10 cents per pound, with most growers receiving extremely heavy dockages in addition. The movement of berries has been about 20 per cent above normal, yet the new season will start with around 40 million pounds of strawberries in storage. These two factors will work together to keep the price lower than the starting price of the previous year, but should help to strengthen the price over that with which the season finished.

FIELD CROPS

Alfalfa - - Acreage remained about the same and prices were a little higher. Yields averaged about one-half ton per acre lower as a result of the spotted alfalfa aphid. In addition, much of the hay that was harvested was aphid-damaged. The total cost of spotted alfalfa aphid to Stanislaus County growers was probably about two million dollars, which reduced the net income considerably. 1957 acreage will probably be down some but the price outlook is fairly good.

Beans - - Total acreage decreased some, particularly insofar as blackeyes are concerned. Baby lima acreage increased considerably. Prices were generally lower and quality was down some as a result of lygus damage. Outlook for 1957 indicates possibility of continued low prices for most varieties and a probable reduction in total acreage.

Grain - - Acreages were down slightly and grain yields were down appreciably. Montpellier yields were very low as a result of the wet weather. Quality was good, however. Irrigated Westside milo yields continued good. Prices of all grains were up a little. Outlook for 1957 is for lower prices because of lower supports.

Field Corn - - Acreage planted for silage increased again as livestock farmers continued to make good use of this feed. Self-feeding silos and machinery for handling silage continue to increase. Grain corn acreage doubled and yields were better than average. Acreage will probably increase in 1957, as farmers change from blackeyes to corn. Silage acreage will continue to be good. Outlook for 1957 is for slightly lower prices because of lower supports.

Sudan Grass - - Acreage decreased a little. The crop continues to be used mainly for dairy cattle in the irrigated section.

VEGETABLE CROPS

Tomatoes - - Shipping tomatoes has become more important each year in the economy of the vegetable industry in Stanislaus County. 1956 prices on green-wraps averaged lower than the previous year. On many fields fruit did not size well enough to demand top prices. Yields were not uniform over the area with *Phytophara* nearly destroying some fields. Several green-wrap fields supplied a picking of cannery tomatoes to bring the canning yield above the 1955 average canning crop yield.

Watermelons - - Watermelon yields and acreages remained about the same as in 1955 with the average price slightly down.

Honeydews - - Honeydews and mixed melons occupied about the same acreage as in 1955. Increased freight rates nearly wiped out any profit growers may have expected.

Peas - - Pea acreage took another slump with the acre yield the same and the price up slightly.

Spinach - - Spinach harvested acreage was down because floods wiped out several hundred acres. Price and yield remained the same as 1955.

Green Lima - - Green lima yields were up probably because of better insect control. Acreage remained normal and prices remained on the 1955 level.

Onions - - Onions that were grown without a contract demanded the highest price in several years if they were ready during the short but attractive selling period. Yields were similar to 1955 with 650 bags the average yield.

Bell Peppers - - Bell peppers yielding 300 crates at \$2.50, the gross return, looked good but with over-all packing expenses up and freight rates up substantially, the net return remained only fair.

Smaller acreages of 23 other vegetable crops added substantially to the over-all income of vegetable growers.

SEED PRODUCTION

Alfalfa - - Certified acreage decreased considerably as a result of the poorer yields obtained in 1955. Prices were generally higher but not enough to compensate for lower yields. Outlook for 1957 is for a possible decrease in acreage as a result of low yields during the last two years.

Common acreage remained about the same. Yields were down but prices were considerably better.

Red Clover - - Red clover acreage has increased to the point where it can be reported separately. Farmers have been generally satisfied with this crop which is grown for use in the Midwest and South. Yields and prices were satisfactory.

LIVESTOCK, POULTRY, AND DAIRYING

Beef Cattle - - Fed cattle numbers were up this year over last year. The number of cattle grown out and produced were about the same with the exception of some purebred herds being dispersed during the latter part of 1956. Because of lower prices, total beef cattle income was slightly less than last year. Lease prices for range pastures advanced.

Swine - - Hog numbers remained about the same and average price for the year was about the same as 1956.

Sheep - - Number of range bands was about the same. Farm flock numbers were up and number of sheep fed was up.

Chicken Eggs - - The steady long-time trend of increased egg production has shown itself again in 1956 with a 10 per cent jump over 1955. During the latter part of 1956, some fryer growers switched over to egg production. Also, many new laying houses were constructed this year.

Fryers - - Fryers showed about a five per cent increase for the year even though there were many empty houses near the end of the year. The price averaged 20 cents per pound as against 26.7 cents in 1955 and 24 cents in 1954. The influx of fryers from southeastern United States has had a big impact on the California fryer industry.

Meat Hens - - Although there were more hens sold, the dollar volume was down from 1955 due to lower prices per pound. The price got as low as 8 to 10 cents per pound for light hens for a time.

Turkeys - - There was another eight per cent increase in turkey numbers, but the birds were sold lighter and at a lower price. The average was five cents per pound less than 1955.

The over-all poultry picture for 1956 indicates more production but sold at a lower price. Production increased from 5 to 10 per cent over 1955 but total dollar income from poultry was \$13,610,890, approximately 2 million dollars less than last year.

Rabbits - - Rabbits showed an increase of about 10 per cent and prices held about even. The No. 1 problem in rabbit production is Mucoid Enteritis and it may be necessary to solve this problem before the rabbit industry can really expand.

Dairying - - Dairying continues to be the No. 1 industry in the county, approximately one-fourth of the total income coming from the dairy industry. During the past year the proportion of the milk produced as market milk increased slightly and during the last part of the year the price was somewhat higher. There have been two significant changes going on in the dairy industry - the number of herds has been decreasing and the size of the herds increasing very materially, and the other change has been a great increase in the building of Grade A facilities. The increase in the amount of production has considerably exceeded the increase in outlets for Grade A milk.

Irrigated Pastures - - The acreage of irrigated pastures has decreased for the second successive year and this is a trend that we think may continue for some time. There is more acreage being plowed up and rotated with a row crop each year. On our dairy ranches much of this acreage that is being plowed out of clover is being put into field corn for silage for about two years. This greatly increases the production of feed on the acreage and makes for a very much improved pasture after it goes back into the pasture crops.

Annual

CROP &

LIVESTOCK REPORT

county of Stanislaus

Foreword

The gross Agricultural Income of Stanislaus County dropped from the all-time high of \$133,890,060 in 1956 to \$128,067,512, the income in 1957. This is a decrease of \$5,822,548. Stanislaus County produces over 80 commercial crops; and because of the great diversity of crops grown, the agricultural income has been very stable. Dairy continued to be the number one industry, amounting to about one-fourth of the total income.

Fruit and nut returns were down due mostly to lower yields. This lower income is also reflected in field and truck crops.

In the summary the estimated income is down from the previous year in all items except livestock, and in nursery stock.

This report contains information on acreage, production, value and conditions of agricultural crops produced in Stanislaus County. Prices are reported on an F.O.B. basis, or as a gross return to the farmer. The gross returns should not be confused with what the farmer may retain as his net returns. Acreages of permanent crops are reported in actual bearing and non-bearing acres, while other crops are reported on a harvested acreage basis. Production is reported in units commercially used in marketing of crops. Some duplication results from reporting gross returns on feed crops and livestock sales where feed crops are grown and consumed on the same farm by livestock on that farm. The same procedure is followed each year in compiling these reports, which makes comparisons possible.

Every effort is made to make this report as nearly correct as possible; however, in some produced commodities the acreage and production must be estimated.

This report has been jointly prepared by the Agricultural Extension Service and the Agricultural Commissioner's office of the county. The Agricultural Commissioner has included the latest data of acreage on permanent crops, while the Agricultural Extension Service has figured the yields and estimated prices for the various commodities produced in the county.

We wish to express our appreciation for the cooperation and assistance of various agencies, such as irrigation districts, cooperatives, local business concerns, producers and others who have made this report possible.

GEORGE A. CROSS
County Director of Extension

MILO M. SCHROCK
County Agricultural Commissioner

FRUITS AND NUTS

Almonds - - The almond crop was rather poor in this county as was the situation over the state. Rainy weather during the blooming period prevented normal pollination. The average price was considerably below the past two years. The net effect was a very much reduced income compared to the previous year.

Apricots - - The apricot crop was slightly larger than that of 1956. This was due to a slight increase in bearing acreage and also a slight increase in tonnage per acre. The average price received was down from the previous years. More fruit was dried than the previous season and more was frozen. The interesting thing about the apricot crop was the large tonnage of the apricot pits sold as compared to that of previous seasons. This was due to a higher than normal average price.

Clingstone Peaches - - The clingstone peach crop was larger than that of 1956. This was due to an increase in acreage and an increase in tonnage per acre. Due to the large volume of clings available, a green-drop of 16 per cent held the per acre tonnage lower than what it normally would have been. The price received per ton was about the same as the previous season.

Freestone Peaches - - The production of freestone peaches is gradually on the increase. This can in part be attributed to a slight increase in net acreage. Also, most of the freestone peach trees are in their early bearing years rather than in their declining years as was the case a few seasons back. The price received from processors was considerably less than a year ago. For this reason, a much larger volume went into dried fruit where the average price was pretty good.

Nectarines - - The volume of nectarines produced was higher than the previous season as was the acreage. Most of the nectarine orchards are very young so there will be an increase in tonnage for several seasons to come. The average price received during 1957 was only about one-half of that received during the previous year. Evidently the supply caught up with the demand rather abruptly during mid-season.

Walnuts - - The walnut acreage and production was slightly larger than in 1956. This was due to an increase in acreage and yield per acre. Walnut blight and navel orange worm destroyed an excessive amount of nuts. The average price received was slightly higher than for the previous season. This resulted in a net increase in the value of the crop.

Minor Crops - - Olives, figs, plums, cherries and pears - - These are minor crops in the county so have little effect on net income. There will probably be an increase in the pear, olive, plum and cherry acreage. The fig acreage will probably continue to decline.

Grapes - - Many vineyards in the county were affected by a delayed leafing out in the spring. Most noticeable were the Grenache. As the season progressed, the wine grapes recovered so that their yields were almost normal. However, the Thompsons had loose stringy bunches and in many instances no set at all so that many growers reported yields down 75 per cent from 1956. As grape yields were down over the entire state, prices received were good.

Boysenberries - - The boysenberries did not leaf out normally this year. There was also a great deal of dieback believed to be caused by the climate. As a result of this dieback, the yield was down 1/3 from the year previous. The price was the same as last year due to large supplies of competing products.

Strawberries - - Yields were down in many fields due to rotting caused by the late spring rains. The price was very poor to start and although it strengthened slightly, a large percentage of the county acreage was removed because the growers did not feel that the price justified further outlay.

FIELD CROPS

Alfalfa - - Acreage dropped more than 20 per cent, mainly because the growers were searching for "high return" crops. Yields were down slightly as spotted alfalfa aphid damage on the Westside was fairly heavy. With slightly lower prices the net income was reduced considerably. 1958 acreage may be down again but the price outlook continues to be fairly good.

Beans - - Total acres increased slightly, although there was some shifting between varieties. Large Limas and Blackeyes increased while baby limas and other varieties were down. October rains caused light to heavy losses in yield, heavy cleaning costs in large limas and red kidneys, and a reduction in quality in many cases. In spite of the rain, average yields were improved but prices were generally lower and total income was down. Outlook for 1958 indicates possibility of continued low prices for most varieties and little change in acreage.

Grain - - Acreages were up a little and grain yields were appreciably better. Yields and quality in the Montpellier area were above average. Milo acreage increased about 300 per cent. In many cases the income was not enough to justify this crop on high value land. Prices of all grains, except for rice and wheat, were down. Rice acreage decreased considerably as over half of the county's allotment was placed in the Soil Bank.

Field Corn - - Acreage planted for silage increased again as self-feeding silos and machinery made the handling of this crop more practical. Grain acreage almost doubled again but yields were down slightly. Many farmers growing corn as a cash grain crop were disappointed because of the low income per acre. Acreage in silage will probably go up again in 1958 but the grain acreage may go down a little. Outlook for 1958 is for prices that will be about the same or slightly lower.

Sudangrass - - Acreage increased considerably as dairymen continued to make better use of this pasture crop in their summer-feeding program.

VEGETABLE CROPS

Tomatoes - - The nine fresh market tomato shippers in Stanislaus County had probably the worst year since the industry started. Prices were unsatisfactory during almost the whole shipping season.

High temperatures during the blooming period caused the flowers to drop for several weeks destroying practically the entire early fruit set. As the temperatures moderated, fruit finally set enough to provide a reasonably good crop of small fruit. There was a wide range of variety response to these conditions with some minor varieties doing very well.

The rains came early and caused thousands of dollars of damage to the canning crop and especially to the fresh tomato crop.

Watermelons - - Watermelon acreage was down in 1957. Acreage potential yield was about normal. Prices started out extremely high, came down steadily as the bulk of the crop came on. During the latter part of the season prices reached a point where it was unprofitable to harvest the crop and several hundred tons remained in the field.

Honeydews and Mixed Melons - - The acreage was about the same as in 1956 with an increase in cantaloupes. The cantaloupe deal was quite satisfactory throughout the season. Crenshaws, Casabas and Persians made some money for the grower. Honeydews were satisfactory until the rains came and then practically every carload lost money for the producers. The melon deal would have been profitable if operations had stopped when the first rains came.

Peas - - Pea acreage took a slight slump. Prices were slightly higher, although the yield varied considerably from field to field. The average yield was quite good.

Spinach - - Spinach acreage remains quite steady because the entire crop is contracted. Yield was up on recoverable spinach. This was especially true when the crop was frozen because of the large increase of acreage in Califlay which is immune to Downy mildew.

Green Lima Beans - - Acreage was down just slightly and prices remained about the same as in 1956. Considerably more effort was put into the controlling of insects and a better job was done. The quality of beans were higher in 1957 than in some previous years.

Onions - - About half the onion acreage is grown under contract and resulted in a rather stable income for the growers. Free onions hit a fair market and made money for the grower in spite of heavy weeding costs. Acreage was up 130 bags to the acre over the 1956 crop. Several relatively small acreages of onions were harvested for seed and green onions. Both of these crops, in spite of the high cost of labor did very well on an acreage basis.

Bell Peppers - - Pepper acreage increased approximately 70 acres in Stanislaus County. The yield was more than double, reaching the high average of 674 30-pound lugs to the acre. The price was down from 1956 but still made money because of the high yield.

Carrots - - A condition that occasionally arises in the fresh vegetable industry is exemplified by the carrot deal in 1956. Carrots were contracted for approximately twenty dollars a ton. A shortage of carrots has been in evidence for six or seven months. Because of this shortage, free carrots went to \$120.00 a ton.

Lettuce - - The lettuce acreage has gradually increased to the point where 2200 acres were grown with an average yield of 200 crates to the acre.

Minor Vegetable Crops - - The acreage of minor vegetables increased from 1348 acres in 1956 to 1878 acres in 1957. There was an extremely wide variation in income per acre in this group but was very satisfactory in most instances.

Sugar Beets - - Sugar beet yield on the 1957 fall-harvested crop increased 1-1/10 ton per acre over the 1956 crop. The yield was heavy but the sugar content was down slightly. A small acreage is always harvested in the spring which tends to increase the average tonnage. The actual price for sugar beets per ton is worked out on a formula involving yield, per cent of sugar and the selling price of the refined product up to the following July first; therefore, the income in this publication is always an estimate.

SEED PRODUCTION

Seed Production - - Certified acreage decreased because of the unfavorable yields during the past two years, and yields were again low because of damaging rains in October. Prices were down resulting in a low income per acre. Certified acreage will probably be lower in 1958.

Common alfalfa acreage decreased greatly because of low demand. Yields were down because of the rain and prices were also much lower.

Red Clover - - The acreage in Red Clover is now sufficiently great to report separately. Yields and prices have been satisfactory, making it a profitable crop for careful growers who are willing to do the thorough job which is required to raise this crop.

LIVESTOCK, POULTRY AND DAIRYING

Beef Cattle - - Fed cattle numbers were about the same this year as last, despite the fact that one feed lot was entirely closed down in the county. Most of the other feed lots all fed a few more cattle this year.

Swine - - Hog numbers were down this year with the average price figures lower than last year.

Sheep - - Number of range bands still the same as last year; however, the number of sheep fed out is down as well as the number of feeders. The wool clip was definitely down also.

Lot price for range about the same as last year. Range - same figures as last year.

Chicken Production - - Egg production increased about six per cent in 1957, due to present operators expanding. Very few new operations started. The average price per dozen eggs dropped 3.5¢, thus reducing the total income by \$370,000. Chicken meat sold at 3.3¢ per pound less than in 1956. Hatching eggs held about even.

Turkey Production - - Meat production increased about 10 per cent in 1957, sold for 4.6¢ less per pounds, thus showing \$200,000 less gross income. Hatching eggs were up almost 20 per cent with the egg price only slightly less, raising the gross egg income by \$209,000. On the basis of this, total turkey income held about even. Egg production was actually higher but many could not be sold and were, therefore, broken out at 30¢ per dozen.

Fryer Production - - Total production held about even but the price dropped about 6¢ per pound. There were less fryer operators, but they leased or rented their building to others. Only one grower expanded in 1957.

The over-all poultry picture shows the same trend as in 1956. More production sold at a lower price per unit, thus yielding about \$400,000 less gross income. The total poultry income for 1957 was \$13,342,742.

Dairying - - Dairying continues to be the number one industry in the county, and approximately 25 per cent of the total income comes from the dairy industry. During the past year there has been a slight increase in the percentage of milk which has been produced for market milk purposes. The income from dairying did not vary greatly from 1956, but the make-up of the industry did change. Herds have increased about eight per cent in size, with many of the smaller herds going out of business. This latter change is due largely to the fact that small herds were not able to carry the capital outlay necessary for Grade A production. The milk from market milk facilities still exceeds the outlets for this class of milk.

Irrigated Pasture - - The acreage of irrigated pasture has decreased slightly, and this has been the trend for a number of years. The main reason for this has been that the practice of rotating irrigated pastures with row crops has increased and it greatly improves the pasture to reseed them.

CROP &
LIVESTOCK REPORT

UNIVERSITY OF CALIFORNIA
DAVIS
MAY 9 1979
GOV'T. DOCS. - LIBRARY

Calif
county of stanislaus
Agricultural Commission

Foreward

The gross agricultural income is \$130,303,196, compared to a revised figure of \$119,855,430 for 1958. This 1958 revised figure was previously reported as \$120,479,038. Stanislaus County produces over 80 commercial crops, and because of the great diversity of crops grown, the agricultural income is fairly stable. Dairy continues to be the number one industry.

This is the largest agricultural income ever reported for Stanislaus County in spite of two adverse weather periods that affected nearly all crops. The late spring was one of the coldest in history, causing retarded development of fruit and delayed germination of many field and truck crops. The middle of September had an unusual heavy rain, causing mold and decay problems in grapes and interrupting harvest of many field and truck crops. There were a few crops picked up this year which were previously unreported.

This report contains information on acreage, production, value and conditions of agricultural crops produced in Stanislaus County for the years of 1958 and 1959. Prices are reported on an F.O.B. basis, or as a gross return to the farmer. The gross return should not be confused with what the farmer may retain as his net returns. Acreages of permanent crops are reported in actual bearing acres, while other crops are reported on a harvested acre basis. Some duplication may result from reporting gross return on feed crops and livestock sales when feed crops are grown and consumed on the same farm by livestock on that farm.

This year the report has been revised in an effort to obtain state-wide uniformity in agricultural income reports for all counties. The principal change is the inclusion of the previous year's production and return figures for comparison with this year, and a new listing and breakdown for some of the crops produced. Due to this new breakdown, the 1958 figures are not available for a few of our crops.

Every effort is made to make this report as correct as possible. However, in some commodities the acreage production must be estimated.

This report has been jointly prepared by the Agricultural Extension Service and the Agricultural Commissioner's Office of the County.

We wish to extend our sincere appreciation to all organizations and individuals who cooperated and assisted us in making this report possible.

4/26/79

Here is the Copy of the Crop Report
you requested. You will find two years in one
copy. For comparison, 1958 and 1959 are in the
this one report.

MILO M. SCHROCK
County Agricultural Commissioner

County Agriculture Commissioner's office

FIELD CROPS

Alfalfa - - Acreage remained about the same. Yields were above normal as there was practically no rain damage during the season and aphid damage continued light. Prices were higher and gross returns were up considerably. The outlook is for acreage to be about the same and prices to be good because of record numbers of livestock and low rainfall.

Beans - - Total acreage was somewhat higher with continued shifting between varieties. Blackeye acreage dropped again while other varieties increased. Yields were generally good in spite of heavy rains and wind damage. Large lima quality was lower because of the rains; heavy hand picking was necessary.

Lima prices were a little higher but heavy hand picking helped offset this advantage in the case of large limas. Blackeye prices were about the same but many off-quality lots were discounted heavily.

Gross income was up slightly. The outlook for 1960 indicates little change in price or acreage.

Grain - - Acreage dropped somewhat and yields were down a little. (The big decrease in barley acreage merely represents an adjustment which should have been made during the past years). Montpelier yields were a little lower than average. Rice acreage increased by several hundred acres but prices were a little under 1958.

Field Corn - - Acreage planted for silage decreased slightly and for grain considerably during the past season. Silage corn continues to be a popular crop with dairymen but grain corn has not been generally profitable, especially in 1959 when grain yields were down by some 25 per cent.

Sudangrass - - Acreage decreased somewhat but dairymen continued to make good use of this crop in their summer feeding program.

SEED PRODUCTION

Alfalfa - - Certified acreage decreased again as a result of another poor year. Yields were hard hit by the September rains. Losses in many cases ran as high as 50 per cent. The outlook is for a further reduction in acreage in spite of possible higher prices because of five successive years of poor returns.

Common alfalfa was again low because of poor demands caused by farmers planting Lahontan. Yields were also down considerably. It appears that there will not be much Common planted during the next year.

Red Clover - - Acreage in red clover almost doubled. Yields were down somewhat but the crop was generally profitable. The outlook is for acreage and price to stay about the same.

VEGETABLE CROPS

Tomatoes - - Cannery tomato acreage was reduced from 9,600 to 2,990 acres from 1958 to 1959. This reduction took place largely because the contract price was not sufficient to warrant a profit and growers considered the long-time average production for this county which is approximately 18 tons per acre. Tomato acreage increased very substantially in spite of the risk a grower must take as far as price is concerned. Price and quality of the shipping tomato in 1959 were very good. Some of the new varieties of disease resistant tomatoes showed up especially well when compared with the older varieties, especially the latter part of the season. There was a total reduction in tomatoes of over 2,000 acres.

Watermelons - - Watermelons were grown on 1,630 acres in 1959 which is an increase of 230 acres. There were wide fluctuations in price during the 1959 season. However, the full season price was very close to the five-year average. Disease was somewhat more prevalent, especially rind rot.

Cantaloupes - - The acreage of cantaloupes increased from 699 acres in 1958 to 1,545 acres in 1959. Yield, quality and price were quite satisfactory.

Honeydews - - The Honeydew acreage was increased from 2,300 to 2,830 acres. Production and price were satisfactory until September 18 when the melon area received two inches of rain. From that time on it was extremely hazardous to ship melons because of the reduced appearance and the actual breakdown during shipment.

Other melons - - Other melons remained quite stable as far as acreage is concerned. The September 18 rain reduced quality on this group of melons but not to the extent it affected Honeydews.

Peas - - This winter crop was severely plagued with weeds to the detriment of efficient handling in all phases of the operation. Several hundred acres had to be salvaged by harvesting the seed rather than for the more attractive price received for cannery and frozen peas.

Spinach - - The acreage of spinach remains quite consistent at approximately 2,000 acres. This crop is almost entirely in the hands of very capable growers. Yields and prices do not vary to any great extent. Leaf diseases are becoming more serious each year and cost of production has been increasing to the point where spinach growing is not as attractive as it was a few years ago. If it were not for the weed control techniques developed in recent years spinach growers would be in a much less advantageous position.

Lima Beans (Processing) - - Growers are becoming more selective each year in choosing the land on which they grow processing beans. Quality is of such great importance in this crop that it becomes the primary factor in a successful operation. Adequate insect control has become considerably more difficult in the past two years.

Onions - - Although onions are a high cost crop they are popular with growers who have the "know how." The price is quite stable for dehydrated onions. The price for market onions was not satisfactory in 1959 but due to the high yields and the efficient use of chemical weed control methods the crop was profitable. Acreage has come up slowly but steadily the past few years because of the natural advantages we have for growing the crop on the Westside.

Bell Peppers - - Experienced growers have been doing quite well with bell peppers. This is a crop that responds especially well to good land and proper management. The adaptation of weed control methods and materials used on other vegetable crops have made pepper growing more profitable than it has been in previous years.

FRUIT AND NUT CROPS

The weather during the bloom period of almonds, apricots and peaches in 1959 was very favorable. The weather continued warm and very favorable for growth throughout the spring period. The percentage set of fruit was the heaviest in recent history.

Almonds - - The almond crop amounted to an average of 2,192 pounds per acre, the heaviest in history. The average price was considerably lower than during 1958 but because of the heavy yield the county income from almonds was about $2\frac{1}{2}$ times that of 1958.

Apricots - - Apricot production per acre hit an all-time high during 1959. The number one problem of the apricot growers was thinning enough off. The use of the hormone, 2,4,5-T, enabled growers to help size their fruit. The price was fair and so combined with a heavy yield, the income from apricots in the county was exceptionally high.

Boysenberries - - The boysenberry industry was beset by more problems which caused an increased pull-out. The bearing acreage for 1960 will be considerably less than $1/2$ of that in 1958. Three primary causes for this pull-out are:

1. Some of the plants were too old for best production.
2. The price dropped in some instances to where they paid only picking costs.
3. The labor situation is such that approximately 500 tons of berries were not picked due to a lack of pickers.

Clingstone Peaches - - The initial set of fruit on the clingstone peaches became a major problem during 1959. Thinning costs were doubled and even tripled in many cases. In spite of the extra thinning the average harvest size was small. Because of the small harvest sizes, the tonnage was not as high as the initial set would indicate. The yield per acre was slightly more than during 1958. The average price per ton was less than that of 1958 but due to the higher yield, the county income was a little higher.

Freestone Peaches - - The freestone tonnage per acre was slightly more than that of 1958. It would have been considerably higher except for the small harvest sizes. The price per ton was slightly below that of 1958 and so was the income for the county.

Grapes - - The grapes were considerably earlier in ripening this season than they normally are, possibly due to the prolonged high temperatures during the summer. The wineries were not equipped for early deliveries. When they did open the growers started their deliveries at a rate greater than the wineries could handle. On September 18 a 75-year precipitation record was established. This caused great alarm among the growers and deliveries were accelerated even more. This resulted in an

almost chaotic situation at some of the wineries inasmuch as prorating did not begin to ease the situation. The price of quality grapes held firm throughout the season at \$42.50. However, bunch rot caused by the rain made a much greater crush of distillery material. These grapes sold generally at \$32.50 or less.

Nectarines - - The nectarine yield for 1959 was slightly below that of 1958. Here again the reduced yield was primarily due to smaller harvest sizes which in turn were due to the very heavy initial set. The price received during 1959 was below that of 1958 so the total income for the county was considerably lower.

Strawberries - - Strawberry prices continued to be slightly stronger than for 1958. A rain just when the harvest commenced gave the growers quite a scare, but fortunately the wind came up and dried the fruit and the season concluded with one of the best harvests in a number of years.

Walnuts - - Walnuts were the only tree crop which had a much lighter set of fruit in 1959 than that of 1958. The yield per acre was down about 25 per cent. The price received for walnuts was somewhat higher than that of 1958 so the income for the county was only slightly less.

Minor Crops - - The acreage of olives, figs, plums, cherries and pears is so small that production and price have little effect on county income. There has been a slight gain in acreage in these crops but it does not look as though they will have any importance in the near future.

LIVESTOCK and POULTRY

Beef Cattle - - Fed cattle numbers are up somewhat over last year and good prices have prevailed the past year. The number of clover cattle have generally maintained their numbers and range cow calf operations are generally the same as compared to the last year.

Swine - - Hog numbers came up a little and market dropped to a near all-time low. However, a general strengthening of prices prevailed in the latter part of the season. A general trend seems to be in increased swine production.

Sheep - - Sheep numbers are relatively comparable to last years numbers with early contracted spring lambs holding a stable price. The wool situation is maintained with a relatively level market. Poor range conditions forced an early market for spring lambs and old crop lambs.

Dairying - - Our #1 industry of the county accounts for approximately 25 per cent of our total income. The trend continues from Grade B (manufacturing milk) to Grade A (market milk) producers. There was six per cent more milk sold as Grade A than the year before. Grade A producers now furnish 58 per cent of our total milk production. This accounts for most of the increased revenue received from milk sales during 1959. Herds are getting larger with less culling during the last half of 1959, which reduced value of beef.

Poultry - - Much of the total dollar increase in poultry and poultry products in 1959 as compared with the 1958 crop report was due to changes in reporting methods. The major exception would be the number of chicken laying hens, which rose approximately 20%. Turkey meat production dropped slightly due to some movement of growers to the surrounding Sierra foothills. The increase shown in this report for chicken fryers was due to more accurate reporting rather than an increase in production.
